

ABSTRACT

A distributed fabrication system for creating, while promoting strategic alignment between information technology departments and business units' objectives, a business application compatible with XInternet technologies via a communication network. The distributed fabrication system supported by an applicative framework system supplying a generic dynamically adaptable N-Tier client-server object-oriented applicative infrastructure constructed on top of a third party software system infrastructure to support a business application compatible with XInternet technologies via a communication network, the third party software system infrastructure being complemented by database management system components.
